Ball Mill

Vertical Planetary Ball Mill(Semi-circle Type)

Application:

Planetary Ball Mill has four ball grinding tanks installed on one turntable. When the turntable rotates, the tank axis makes planetary movements, the balls and samples inside the tanks are impacted strongly in high speed movement, and samples are eventually ground into powder. Various kinds of different materials can be ground by the mill with dry or wet method. Minimum granularity of ground powder can be as small as 0.1μm.

Solid Phase Extraction System

Introduction:

The solid phase extraction system is a negative pressure solid phase extraction device. It uses a solid adsorbent to adsorb the target compound in a liquid sample, separates it from the sample matrix and interfering compounds, and then eluates it with an eluent or heats to desorb it to achieve separation and Purpose of enrichment of target compounds (i.e. the separation, purification and enrichment of the sample), the solid phase extraction instrument aims to reduce the interference of the sample matrix and improve the detection sensitivity.

Features:

* The whole machine of 12, 24, and 36-well square solid phase extraction instrument is made of transparent organic glass, which has strong corrosion resistance;
* The wall thickness of the vacuum tank is uniform, so it can withstand high negative pressure above -0.096Mpa, and it will not deform after long-term high-pressure use;
* The pressure is uniform everywhere, the air tightness is good, and the stability is strong;

Benchtop pH Meter

PH-25

PH-3CU

Introduction:

pH meter is an electrochemical instrument designed for the precise measurement of the acidity or alkalinity(pH value) of an aqueous solution. Its core component is a glass electrode sensitive to hydrogen ions. The device operates by measuring the potential difference generated between the electrode and the solution, which is then converted into a corresponding pH reading based on the Nernst equation. To ensure accurate measurements, regular calibration using standard buffer solutions is required. The pH meter is widely used across various fields, including industrial process control, environmental monitoring, food safety, pharmaceutical and biochemical industries, as well as agricultural research, making it an essential tool for quantitative analysis and quality control.

Chiller

Recirculating Chiller

CCA-420

DLSB Series

Principle:

This product is mechanically cooled by a fully closed compressor. The inner wall of the cooling tank has a cooling copper coil. The refrigerant (Freon) circulates continuously through the coil of the inner wall of the tank to cool the refrigerant in the tank, and the refrigerant is transported to the sandwich or condensing coil of the supporting equipment through the built-in circulation pump and external circulation pipeline. Indirectly cooling the materials in the reactor, cooling and liquefaction of the condensing pipe contact steam.

This product can generally be connected to the sandwich of the double layer reaction kettle, the rotary evaporator, the condensing coil of the reaction kettle, and can also be used to put the object or container to be cooled directly into the bath for reaction.

From the lower outlet pipeline of the product is connected to the lower inlet pipeline of the kettle body or condenser, and the circulating liquid comes out from the upper circulation port and returns to the inlet of the product through the pipeline, forming a complete circulation space.

Features:

- Famous manufacturers of original closed compressor, advanced performance, reliable quality.
- Professional relays, protectors, capacitors, etc., are well-known brands of high-quality equipment to ensure reliability and service life.
- Digital display temperature control, simple operation, eye-catching.
- A variety of functions, can provide low temperature quality cooling water, low temperature unfrozen liquid, small low temperature water bath.
- Can be combined with circulating water type multi-purpose vacuum pump, vacuum freeze-drying oven, rotary evaporator, magnetic stirrer and other instruments, suitable for multi-functional low temperature conditions of chemical reactions, drug storage.
- It can be matched with a variety of large precision equipment to overcome the difficulty of expensive instruments and equipment that can not be used because of bad cooling water, high temperature and unstable water pressure.

Standard Peristaltic Pump

Introduction:

Peristaltic pumps are mainly used for various liquid transfer. The peristaltic pump driver provides power to drive the pump head to run, and the rotor in the pump head rotates, relying on the pumping efficiency generated by the alternate extrusion and release of several rotors along an elastic hose to work. The squeezed fluid in the tube produces flow output, and when the tube returns to its original state by its own elasticity after the pressure disappears, the volume increases, a vacuum is generated, the fluid is sucked in, and the cycle is repeated.

Features:

* Full speed function: realize fast filling and emptying.
* Speed regulation function: The speed can be adjusted manually, or controlled through an external control interface.
* Direction function: reversible forward and reverse.
* Display function: display the current speed, direction and status.
* Power-off memory function: memorize the working state before power-off (continuous work for more than 5s)

Digital Melting Point Apparatus

Introduction:

The principle of the melting point apparatus is based on the phase transition process of matter, that is, the transition from a solid to a liquid state. When measuring with a melting point meter, first place the sample to be tested in the sample chamber and ensure that the sample is in a solid state. Then, heat is applied to the sample through a heating system, gradually increasing the temperature of the sample. At the same time, the observation system records and displays the temperature change curve of the sample. When the sample reaches its melting point, the solid material begins to melt into a liquid state. This process absorbs heat, causing a noticeable steep drop in the temperature curve. The melting point meter determines the melting point of a substance by monitoring this temperature change.

Features:

* Can connect to a computer for data transferring.
* Touch screen.
* Use PID & PWM to control the temperature.

It utilizes the differences in partition coefficients and adsorption capacities of various components between the two phases, achieves separation through repeated distribution equilibrium, and combines with detectors for qualitative and quantitative analysis.

Features:

- The system offers a comprehensive and flexible isocratic mode, and also provides binary gradient and quaternary gradient systems. Detection capabilities include PDA, UV/VIS, FL, RI and ELS.
- The new optional, solvent manager units can easily switch 4 to 8 kinds of solvent base on binary gradient system. There are several configurations available for user selection.
- The real-time solvent pressure compensation control enhances detection precision. The integrated check valve ensures stable fluid delivery and simplifies maintenance.

BK-P3

Introduction:

Polarimeter is an instrument used to determine the rotation of a substance, and its working principle is based on the rotation of polarized light. By measuring the rotation angle of the sample to the polarized light, the concentration, content and purity of the substance can be analyzed and determined. Natural light through the polarizing mirror to produce plane polarized light, when the tube is filled with optical substances, polarized light through the material solution, the angle of polarized light will rotate to the left or right a certain angle. In order for the polarized light rotated at a certain angle to pass through the polarizer grating, the polarizer must be rotated at a certain angle so that the brightness can be seen at the eyepiece. This angle of rotation is the rotation of the solution of the substance to be measured.

Features:

* Color touch screen.

Portable Soil Irromerter Tensiometer

Introduction:

Soil Irrometer tensiometer is made up of pressure gauge, acrylic tube and ceramic probe, after the acrylic tube filled with water, ceramic probe gets wet and it can prevent outside air into the ceramic probe. When there is pressure difference between measured soil water potential and tensiometer, the water in tensiometer will infiltrate into the measured soil until the balance reached. So at that moment, the value shown on the pressure gauge is the measured soil water potential.
